Style Guide

- Don't repeat code: If you're writing the same thing more than once, turn it into a function or a shared component so we can reuse it later.

- Name server and client stuff differently: Top-level server files (the main ones that load pages) should be named something like page.jsx. Regular client components should use CamelCase, like LostFoundForm.jsx.

- Group common functions: If you're writing a function that's used in more than one place (like checking if a user is logged in), move it to the utils folder so everyone can use it.

- Keep functions short: Each function should do one clear thing. If it feels like it's doing too much, break it into smaller pieces.
